

SDLC Overview infographic

The SDLC is a structure process to develop high-quality software through distinct phases.

1) Requirements : understand customer needs to set clear expectations.

importance - prevents costly misunderstanding.

2) Design : create system architecture and blueprints.

importance - Guides developers and reduces errors.

3) Implementation : Develop the actual software by coding

importance - Turning plans into a working product.

4) Testing : validate functionality and find bugs.

importance - Ensures software quality.

5) Deployment : Launch the software for end-users

importance - makes the solutions operational.

Interconnection -

phases flow sequentially with feedback loops, Agile models revisit phases iteratively.
